

Sentiment analysis for Interview reviews

John Lim
DSI 17

Problem Statement

- A company has approached my team to review their interview process.
- The client wants to give their candidates the best interview experience regardless of whether they were accepted for the job.
- By doing so, they hope to achieve more positive interview reviews, strengthen the company branding and ultimately attract more talent.

METHODOLOGY

DATA
GATHERING

EDA AND PRE-
PROCESSING

MODELLING

FINDINGS AND
LIMITATIONS

Methodology

- Analysing companies with thousands of interview reviews on glassdoor
- Build a model that is optimized and tuned based on accuracy score.
- The model will be able to tell if an interview feedback is a positive or negative sentiment
- Companies can then use the insights to train their HR and hiring managers to adopt or avoid certain attributes during an interview process

Software Engineer - New Grad Interview

Anonymous Interview Candidate in Seattle, WA (US)

☒ No Offer

☒ Negative Experience

☒ Easy Interview

Application

I applied online. I interviewed at Microsoft (Seattle, WA (US)) in October 2020.

Interview

I was emailed by a recruiter around 2 weeks after applying for a first interview. That went pretty well, only one LC easy and background questions. I was called back for a second round which was supposed to be a day with 4 interviews. They canceled the last one and told me only after I emailed them during the supposed time. The three other interviews were pretty bad, interviewers didn't have their cameras on and didn't seem interested in what I have to say at all. I also haven't heard back from them yet.

Interview Questions

Top 5 numbers in an array without sorting, Remove duplicates from array in place, Binary search algo, Valid parans
What are distributed systems, microservices, APIs
What do you think about Agile development

[Answer Question](#)

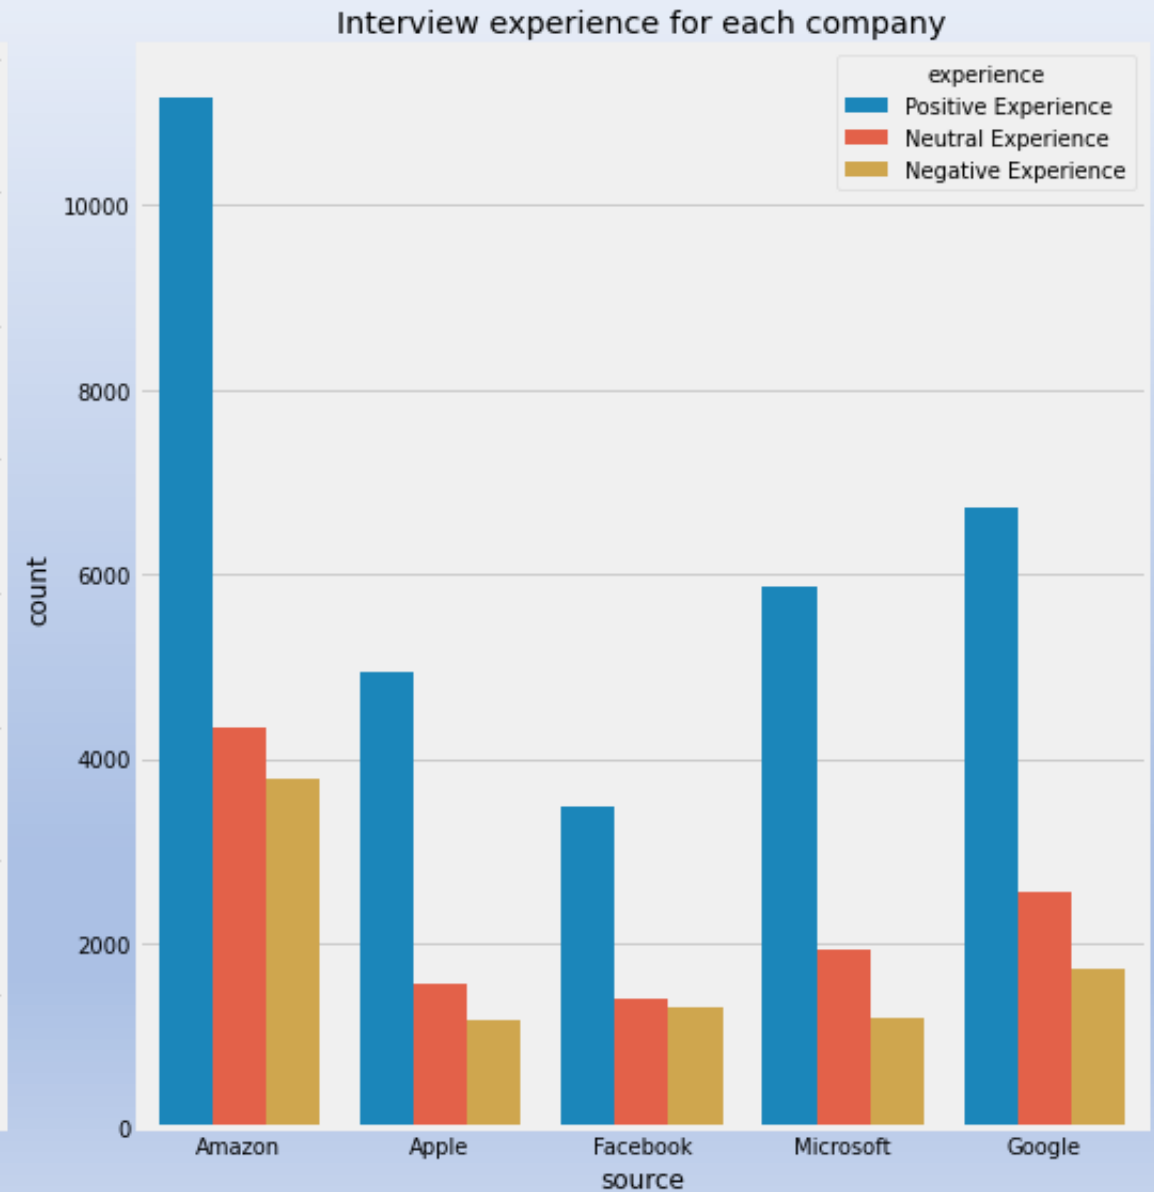

Data Gathering

Web Scraping Apple, Microsoft, Facebook, Google and Amazon glassdoor profiles for their interview reviews

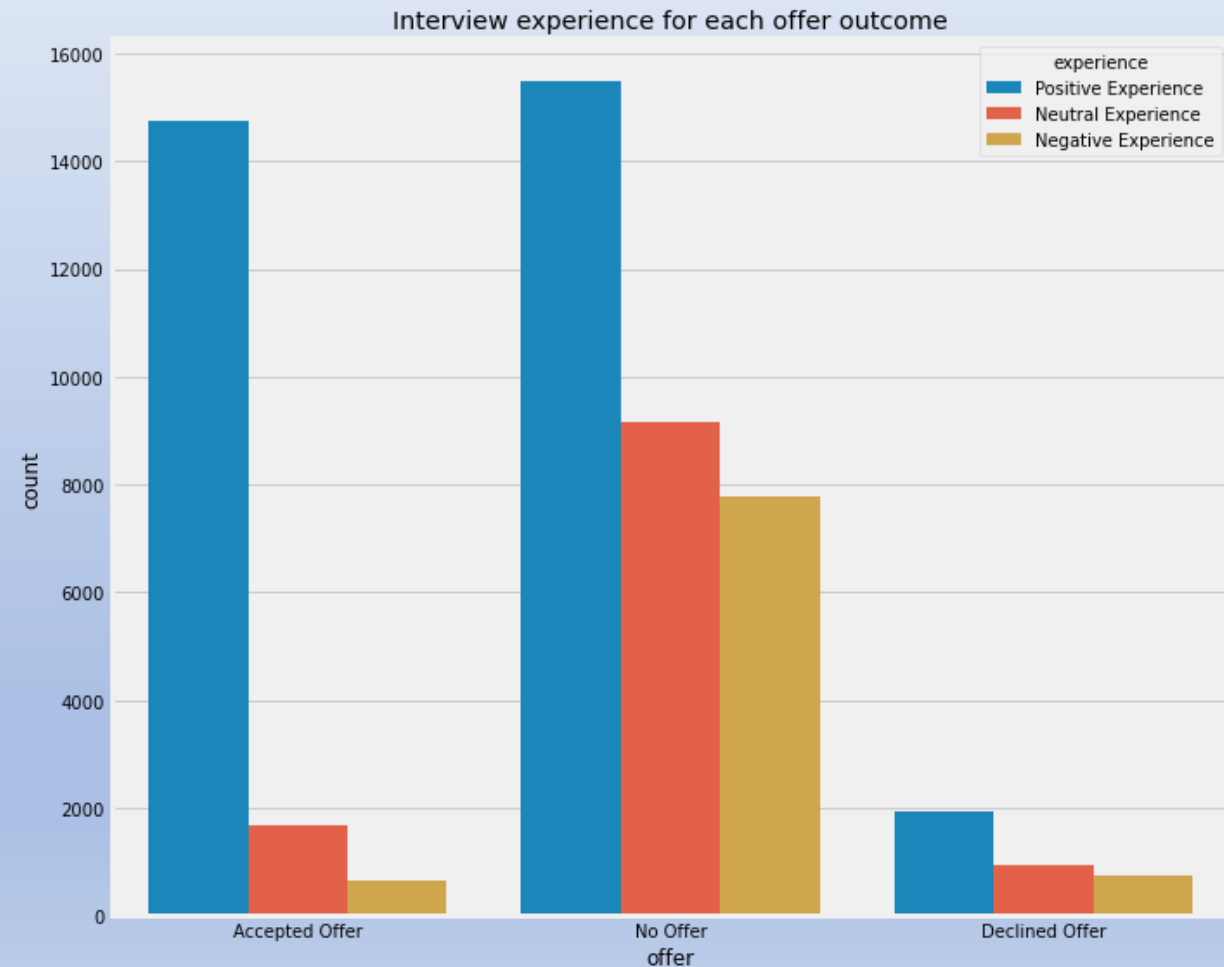

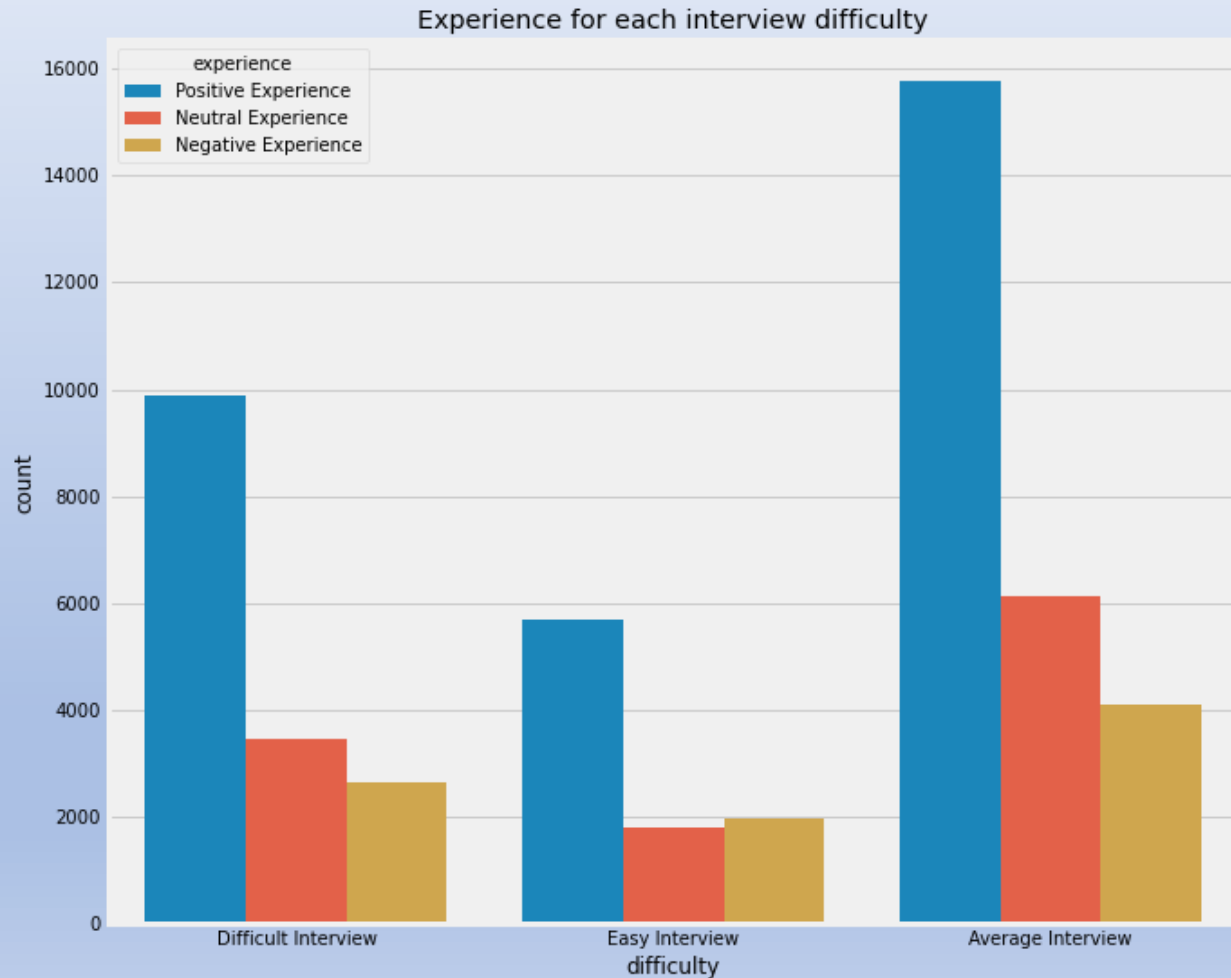

Interview experience from respective companies

Interview experience and their difficulty/acceptance

Count of words for positive and negative reviews

Distribution of word count for positive and negative reviews are generally the same

Correlation between different features and interview experience

The highest correlation among the features and interview experience is offer

Dealing with imbalanced class

- Scraped reviews from other companies on glassdoor and added the negative reviews into original data.
- Increase our negative reviews from 4762 to 11800
- There are 21079 positive reviews for our majority class

Negative
Experience

Positive
Experience

	Actual Positive review	21	169

Findings

Words highly correlated to negative review

Words highly correlated to positive review

Examples of positive and negative shopee interview reviews

Negative Experience

- One technical round. The interviewer provided a false link at the beginning. The interviewer does not even know Java and he kept asking how to design a dynamic size array in Java without reallocation. This is utterly disgusting.
- The entire interview process was very disrespectful. They don't ask for your free time and simply give you a time. During the interview, they can be up to 30 minutes late! They don't seem to have much good things to say about the company too. A senior manager said work environment is very stressful.
- Phone interview, sent me an email to schedule phone interview. Sent email afterwards to ask why I didn't get the role and if there's anything I can work on. Did not get a reply.

Positive Experience

- The recruiter is very nice and she will explain to you how the company views the most for this position. Phone interview is not difficult and then she directly gives me the chance for a 2nd round test interview. The test interview is about 1.5 hrs and the Python&SQL questions are very basic.
- Phone interview with HR first then direct interview with the cat managers. both interviews were quite fast, within 30 minutes, i think the phone interview was shorter and the hr person was very friendly
- HR Manager was friendly and provided information before the interview took place. There was a better understanding of the happenings and the overall reputation of the company at present. The questions were as expected (i.e. tell me more about yourself, why are you applying for Shopee, etc).

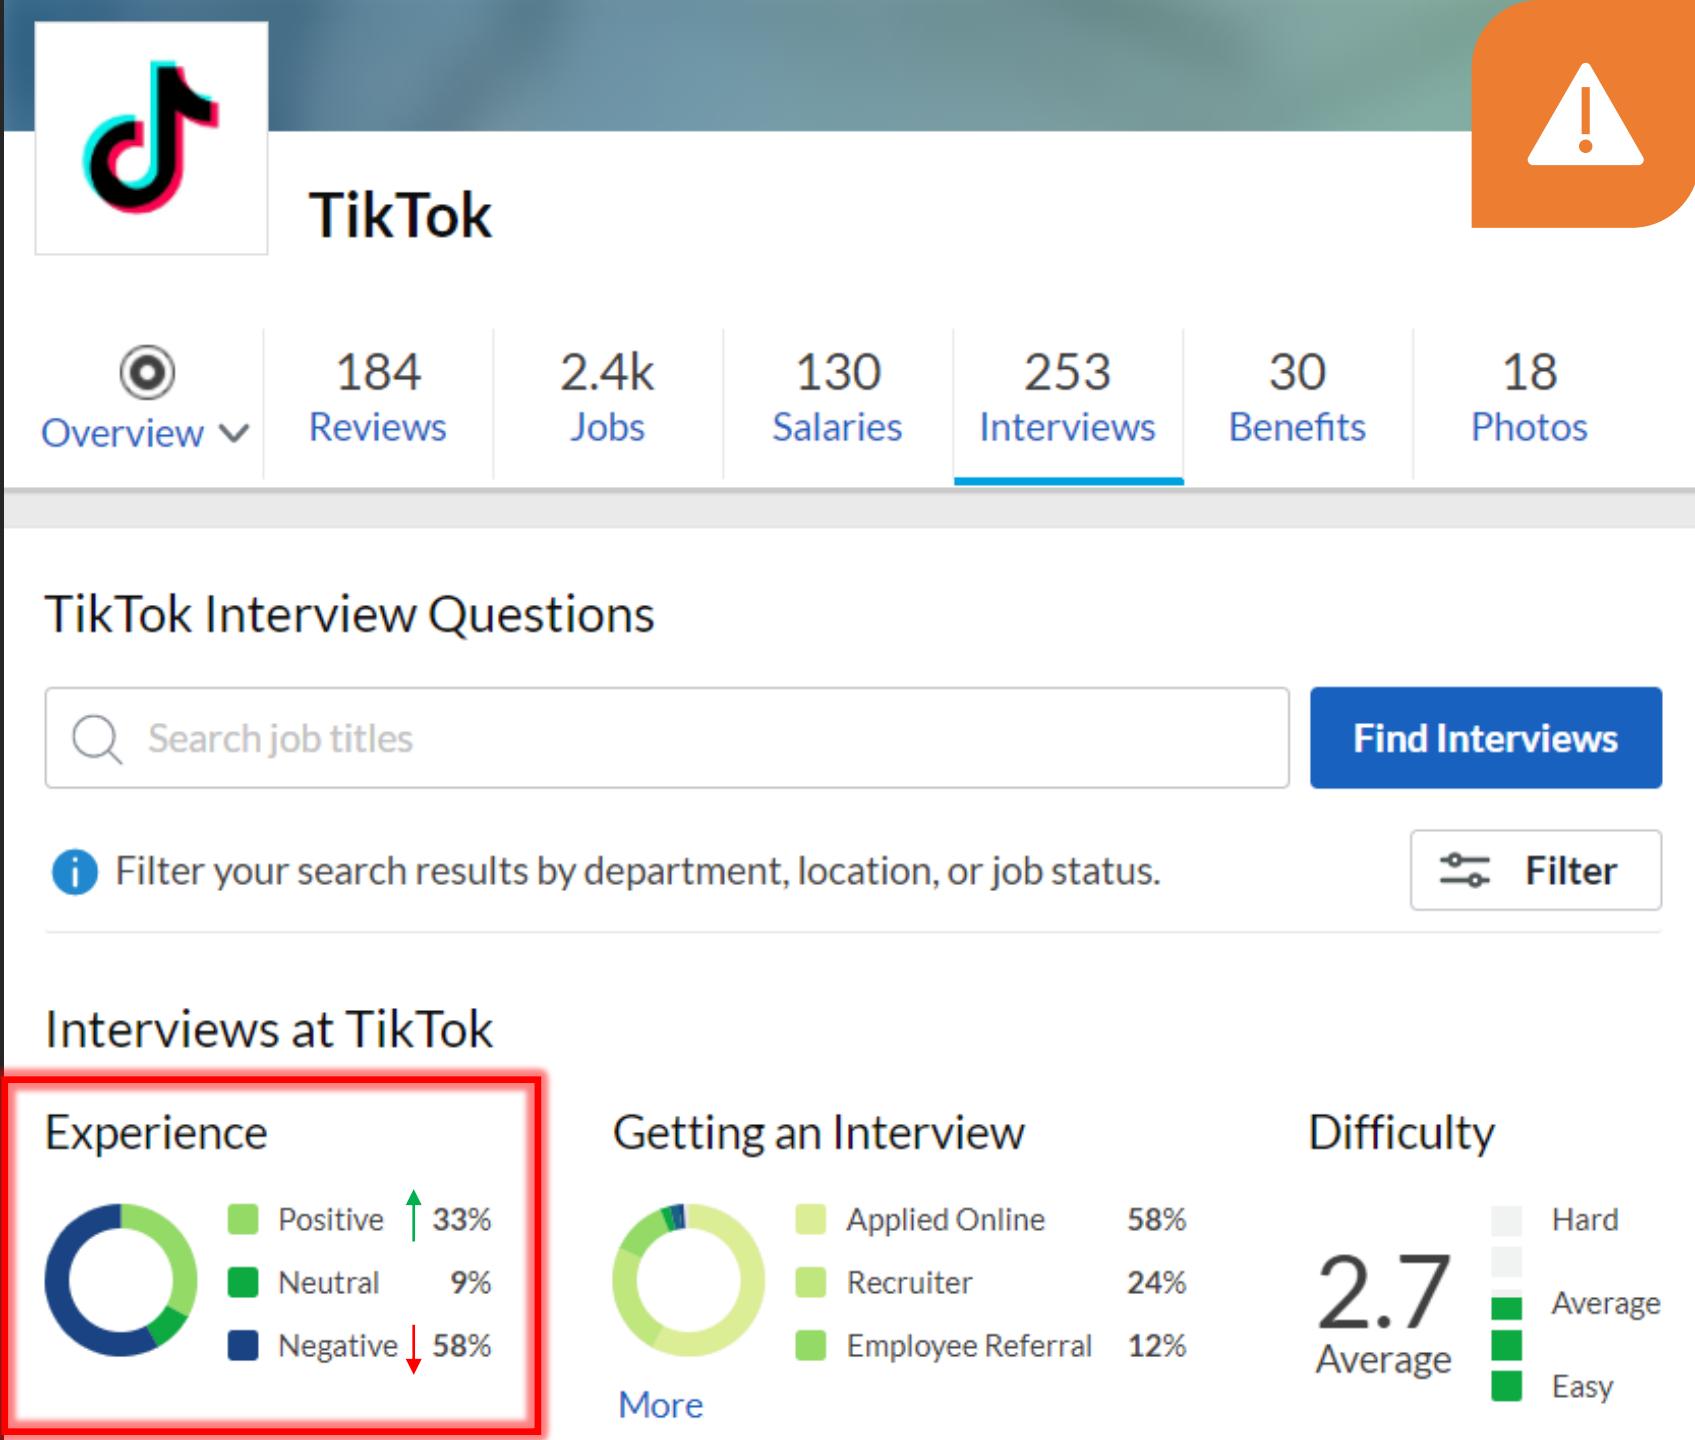

Limitations

- Words that are new to the corpus will not be considered when doing vectorizing transformation and prediction
- If the review is in another language, our model is not able to accurately predict the sentiment
- Sarcasm within a review might result in inaccurate prediction
- Logistic model assumes linear separability between different texts. However in reality, texts or comments are not exactly linearly separable
- Some of the key words with high coefficients tend to be very subjective and scalable. For instance, nice is the word that has the highest coefficient for positive experience, however it is very subjective and there are too many variations of nice. Hence there is still a need for someone to review and validate if certain predictions makes sense

Increase positive interview experience

- Any company who have collected feedback from interviewees and want to understand the sentiments and gather insights can adopt this model
- Analyse feedback gathered from interviewees, and find out areas that they can improvement on
- This will probably help them achieve a higher positive interview experience rating on their public profiles, achieve a better company brand and attract more talent
